Scrumfall Overview

Agile Board Definitions

Issue Types

The following are the types of issues that are typically documented and tracked on your Agile board, which could be analog (e.g. whiteboard, sticky notes), or online (e.g. JIRA, Pivotal Tracker).

Epic:

An epic is a feature or requirement that is either too big to be completed in a single sprint, or that has too many unknowns to have its level of effort accurately estimated. Another good rule-of-thumb is that if a User Story will require more than 2 days to complete it should probably be considered an epic and broken down into smaller stories.

Epics can be broken down any time, but Sprint Planning and Backlog Grooming are good opportunities to do so.

Story:

A story, or user story, is a description of a requirement with particular attention to the end user's point of view. It describes something a user is hoping to do with, or get from, the system.

Many teams have learned the benefits of writing user stories in the form of: "As a <type of user> I <want/can/am able to/need to/etc.> so that <some reason>." But it is not necessary that a user story be written this way.

A story is granular enough that it can be completed in a single sprint, and ideally in less than 2 days of effort.

Bug:

A bug, or defect, is a problem with the system that needs to be fixed. A bug can be created by anyone, although they are typically logged by QA. A bug is often created if a defect is found that relates to an already completed piece of functionality (for example, if new work introduces a bug into previous work). If a defect is found on a story while the sprint is still on, it should be noted in the story and assigned back to the dev team member. For example, if a bug is found while a story is in QA, the defect should be noted in the story's description and then assigned back to the dev. In this case a separate bug issue is not created.

Sometimes, if a small bug is found for a story during its demo to the Product Owner, we might choose to accept the story itself and log a separate bug to tackle the minor defect. If the bug is medium to large, though, the story should be rejected.

Task:

A task is something a development team member needs to do on the way to completing a Story. After a dev commits to a story for the upcoming sprint they can begin to break down that story into tasks. Additional tasks may also be created while the story is being worked on during the sprint, as required.

Tasks are given effort estimates in hours.

Issue Metadata

The following are some of the details and metadata that should be attached to issues on the Agile board.

Definition of Done (DoD):

Before a story is started, it should have the following:

1. A clear title and description.
2. Effort estimate (relative points are best, but hours can also be used).
3. Test cases.
4. Acceptance criteria.

If a dev completes all of a story's tasks, the story passes all the test cases, and finally, it meets all the acceptance criteria, it is said to meet the DoD and is production ready.

Components:

Sometimes there are Stories that span across multiple epics which all relate to a common feature. For example, a user registration system may be complex enough that its user stories belong to more than one epic. In this case we can relate all of these stories together by associating them with a Component, (also called a Theme). Examples of possible components are "User Registration", "Database", "User Interface".

Both epics and stories can be associated with a Component.

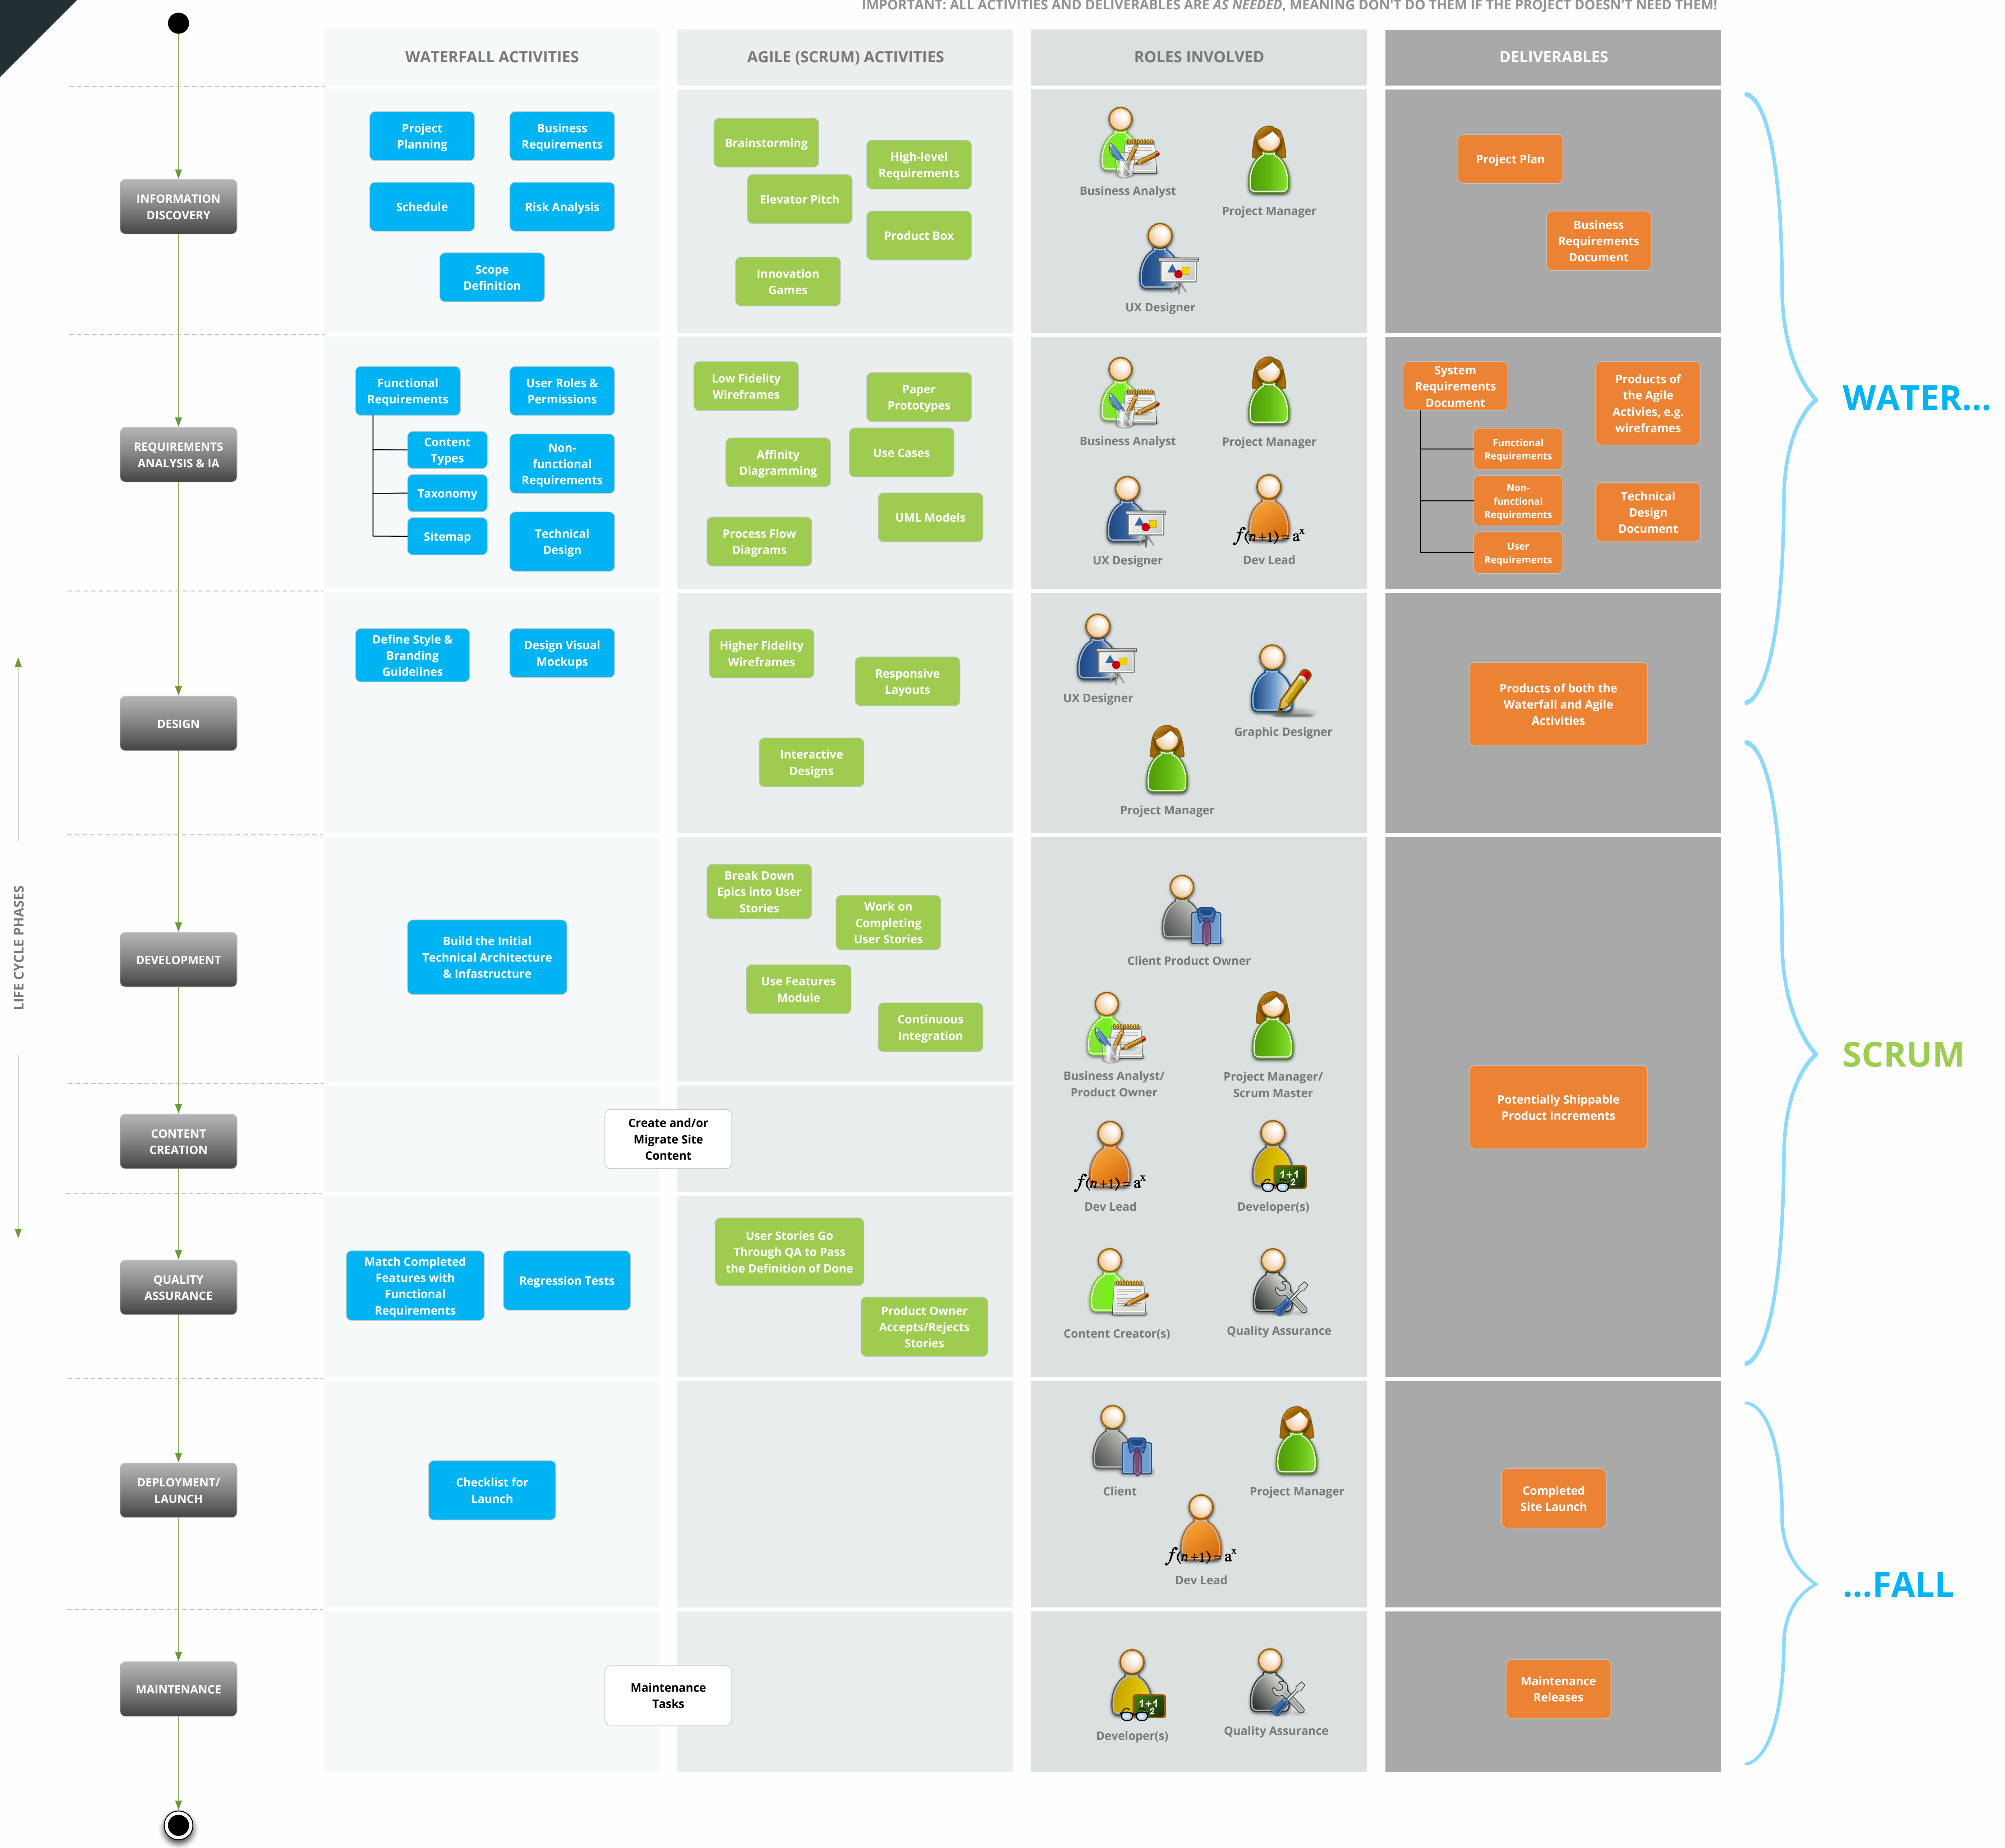

Versions:

Stories can be assigned to versions, e.g. 1.0, 2.4. This isn't needed on every project, but can be useful on projects where the development is broken up into multiple phases because of budget constraints, scheduled releases, etc.

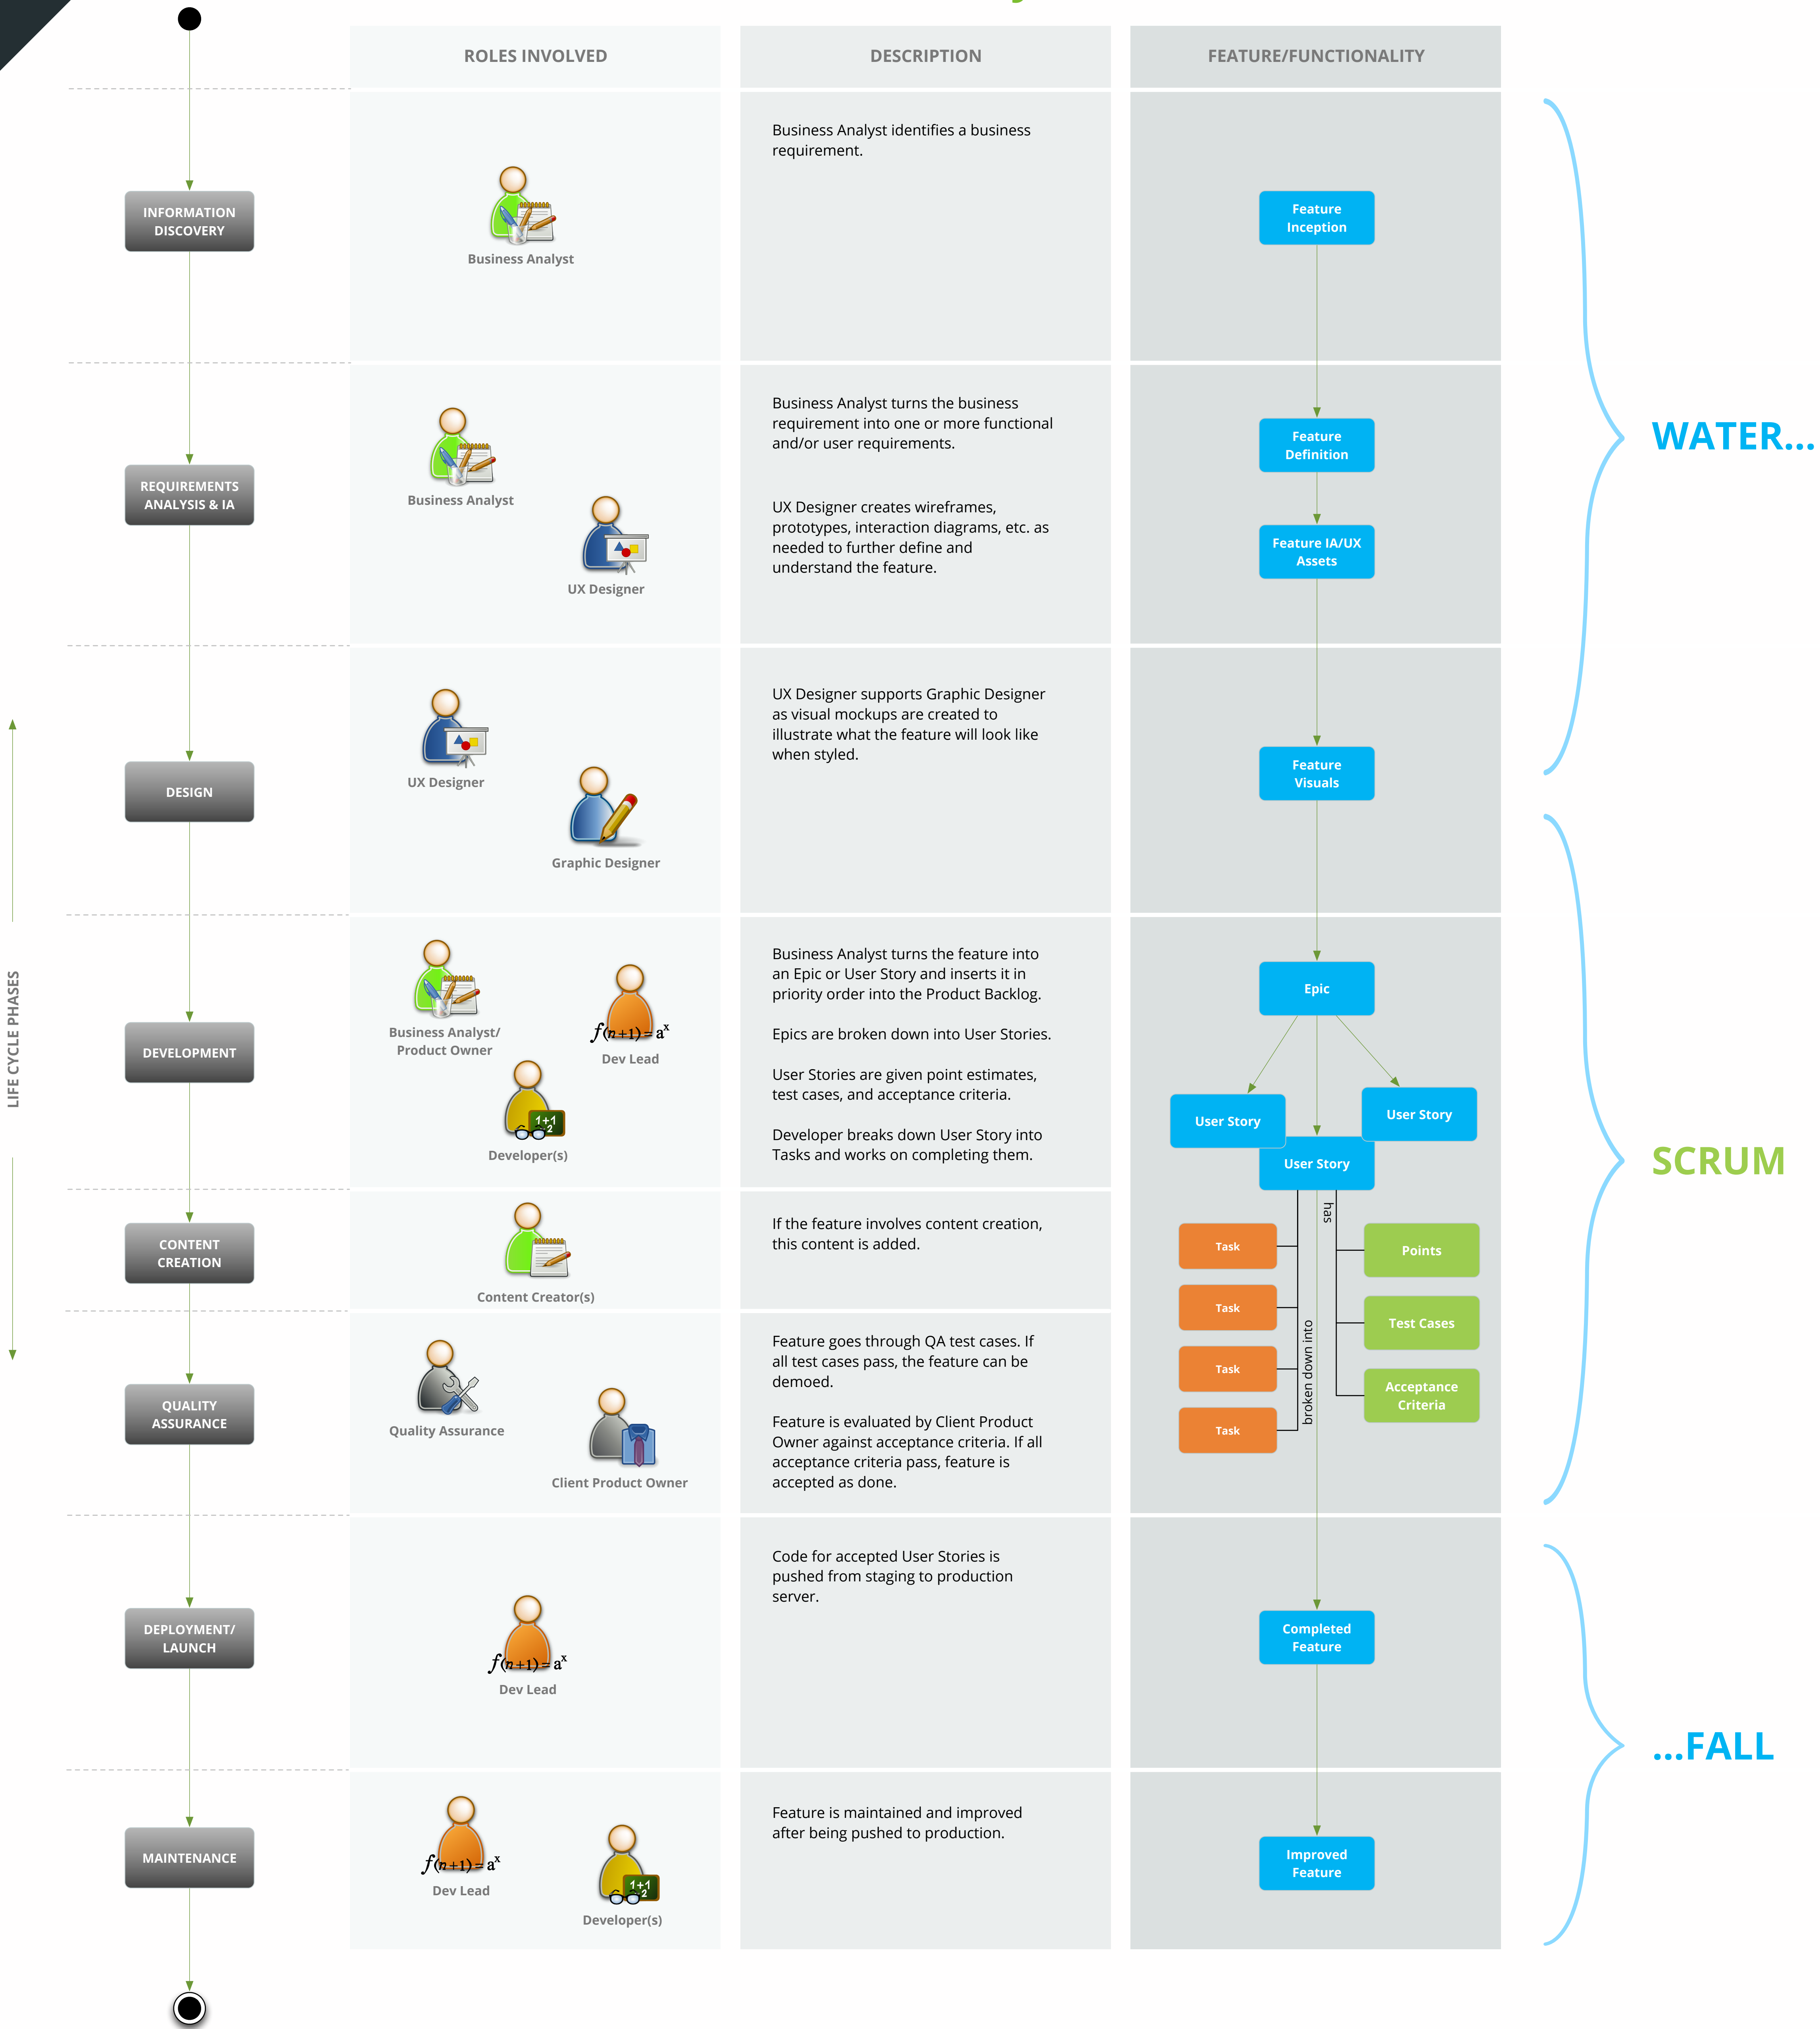

Scrumfall Breakdown

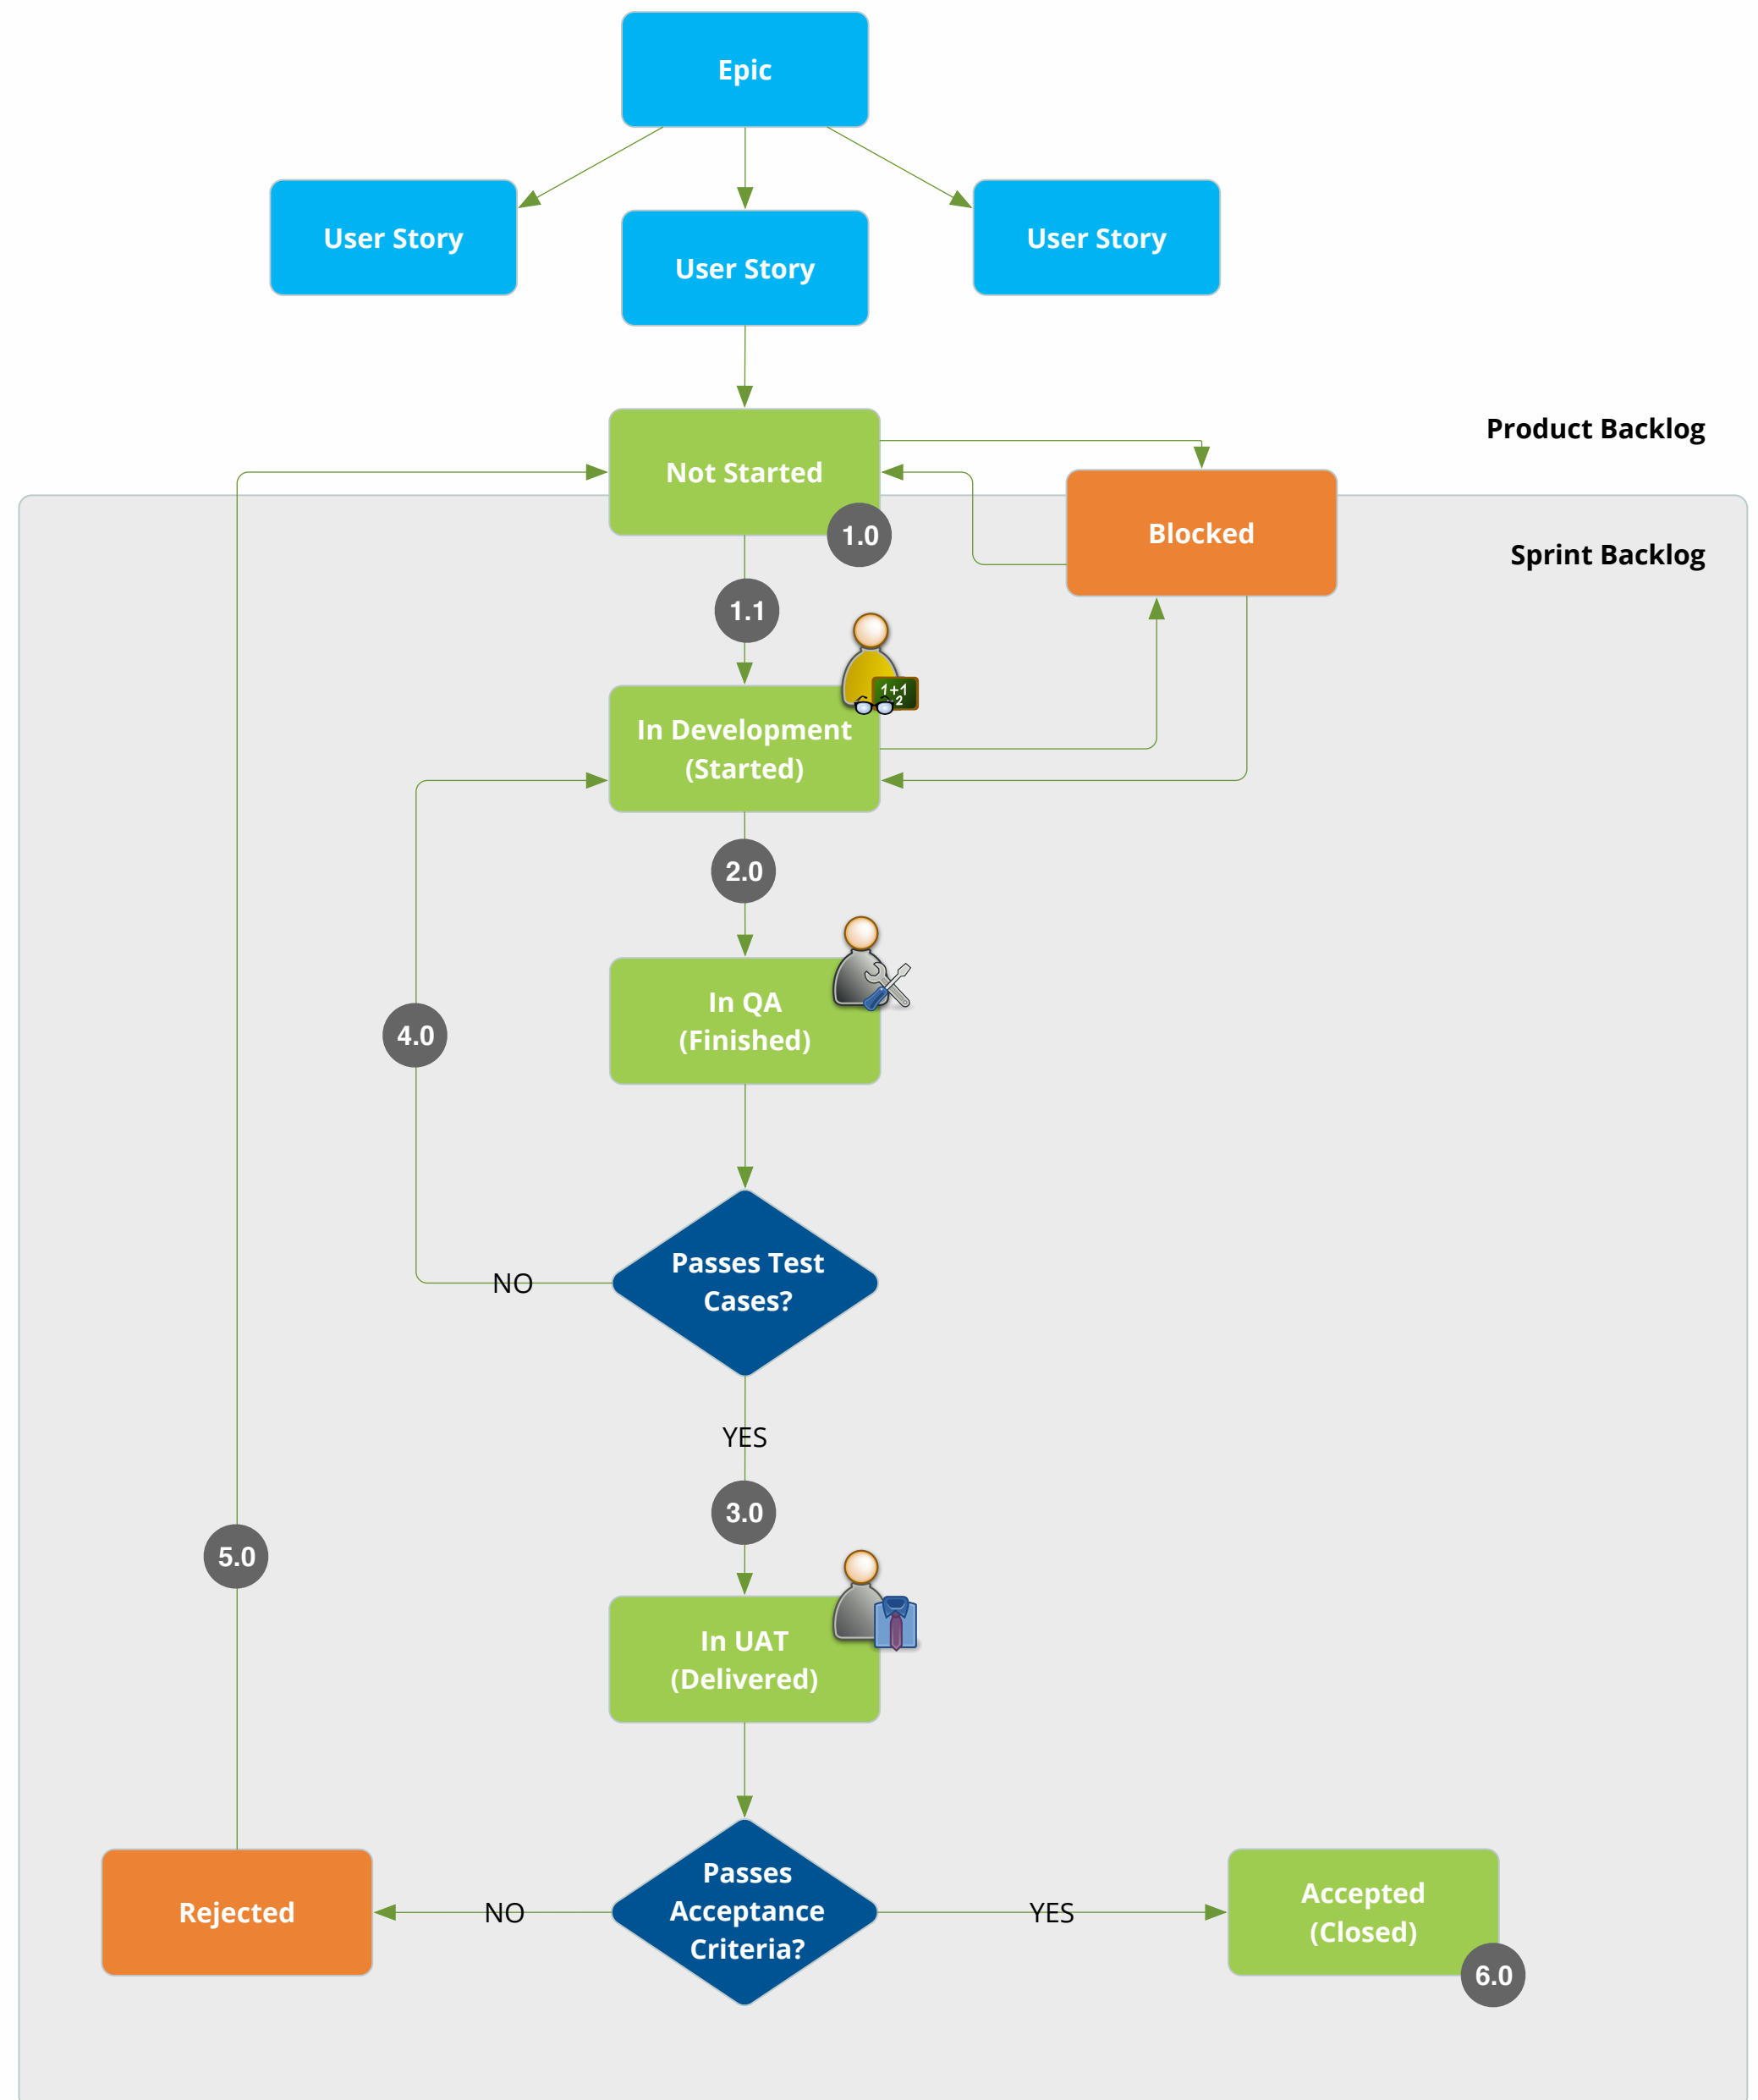

IMPORTANT: ALL ACTIVITIES AND DELIVERABLES ARE AS *NEEDED*, MEANING DON'T DO THEM IF THE PROJECT DOESN'T NEED THEM!

Feature Life Cycle

User Story Workflow

Assignments:

1. Dev team member commits to a user story during Sprint Planning.
- 1.1 Story marked as "In Dev/started" when dev member begins work on it.
2. Story completed by dev and marked as "In QA/finished". Assigned to QA.
3. Story passes QA and marked as "In UAT/delivered". Assigned to Product Owner.
4. Story reverted back to "In Dev/started". Assigned back to dev team member.
5. Story reverted back to "Not Started". Assigned back to dev team member. Likely immediately added to the next sprint.
6. Story meets our Definition of Done. Assigned to whoever created the story (likely a BA) and closed.
